

Postea was founded in 2007 and it wasn't long before the company was awarded the first of its patents and was well on its way to developing its breakthrough product, QubeVu.

QubeVu. Instant dims and data, from almost anything.

With QubeVu, dimensioning is just the beginning. In a single, instantaneous scan, QubeVu captures dimensions, weight, barcodes and OCR data — even a photo of the item for verification and claim protection. QubeVu scans anything: parcels, documents, tubes, polybags, pallets, and non-conveyable freight — even irregular shapes.

Volumetric management, revenue optimization and compliance

From e-commerce and express logistics to bulk freight, supply chain and retail QubeVu brings a new level of intelligence to every scan — enabling system-wide volumetric management and enhancing revenue optimization and compliance. No matter your industry, QubeVu can help you capture significantly more revenue and manage resources more efficiently. And QubeVu supports Big Data analysis to reveal even more savings and growth opportunities.

Painless integration

QubeVu's patented 3D dimensioning technology outperforms other systems at a fraction of the cost — all in an economical, zero-footprint design requiring no buildout. Add QubeVu seamlessly to existing operations or flexibly deploy units to spread load and eliminate bottlenecks. Pole, wall, and ceiling mount options mean QubeVu can be used anywhere — over rollers, tables, or floor scales. And our new Handheld version is now in Alpha release.

Unparalleled reliability and ease of use

QubeVu is packed with smarts, not belts and gears. No moving parts means greater reliability, simpler repair (MTTR < 10 minutes), and incredibly easy operation. QubeVu requires no parcel alignment or special handling and, of course, no waiting, so efficiency goes up while labor costs go down.
